

LSF 901BMR

Usage: Grazing and Haying

Benefits/ Features

- Dual Purpose Forage used for Silage, Grazing to Green Chopping
- Very Sweet Stem with Excellent Green Leaf Retention
- Brown Midrib Characteristic Increases Digestibility
- Excellent Foliar Disease resistance and Maintains a Healy Canopy Until Harvest
- High Palatability
- Designed to be a On-Time Harvest Hybrid; However does have a Good Re-growth Capabilities

BMR

The Brown Midrib (BMR) trait is a unique and a highly beneficial trait. The trait expresses itself as a brown pigmentation that appears in the leaf midribs, stems, and other plant parts. BMRs reduce the lignin content of the whole plant by 40 to 60%. This trait improves or increases digestibility significantly (15 to 30%) and increases palatability greatly. BMRs mature quicker plus they take less water after entering the boot stage
